UEAB SMART NOTICEBOARD

One-Page Business Model | ISC Digital Build-Off 2026

Value proposition
A centralized digital platform where university administrators can publish official notices and students can conveniently discover, search, and read current announcements.

1. Problem

University announcements may be spread across noticeboards, messaging groups, emails, and informal channels. Students can miss important updates, while staff may need to repeat or redistribute the same information.

2. Customer segments

Primary users: University students seeking timely academic, examination, event, and administrative notices.
Operational users: Authorized university administrators and staff responsible for publishing announcements.

3. Solution & key features

- Role-based administrator and student access
- Create, edit, publish, and manage notices
- Notice categories and publication status
- Student notice feed, full notice view, and keyword search
- Centralized MySQL database and browser-based access

4. Channels

- University website or approved student portal
- Official university communication channels
- Orientation sessions and departmental demonstrations
- QR code or link shared through approved campus channels

5. Value to stakeholders

Students: One place to find published notices and search for relevant information.
Administrators: A structured way to create, categorize, publish, and manage notices.
University: Potentially clearer communication and reduced dependence on scattered announcement channels.

6. Key resources & activities

Resources: Web application, PHP, HTML, CSS, JavaScript, MySQL, XAMPP for local development, hosting, and authorized administrators.
Activities: Maintain the platform, publish accurate notices, manage user access, back up data, and support users.

7. Cost structure

- Initial development and testing time
- Web hosting, domain, and database maintenance
- Backups, security updates, and technical support
- User onboarding and ongoing improvements

8. Sustainability / possible revenue

Proposed institutional model: the university adopts and funds the platform as a campus communication service. If offered to other institutions in future, possible options include an annual institutional subscription or a setup-and-support fee. These are proposals, not confirmed revenue.

9. Success measures

- Number of active student and administrator accounts
- Number of notices published and viewed
- Time taken to publish an announcement
- Student feedback and reported ease of finding notices
- System availability and notice accuracy

Current prototype: PHP, HTML, CSS, JavaScript, and MySQL; developed locally using XAMPP. The business model above is a proposed direction for validation with students and university stakeholders. Do not present proposed pricing or adoption as already approved.
